

REMARKS

Claims 1-54 were canceled and new claims 55-70 were added. The new claims are believed to render moot all of the objections and rejections presented in the Final Rejection dated December 30, 2004.

No new matter was entered. All of the currently pending claim limitations are fully supported in the present specification.

Request for Interview Prior to Formal Action on Amendment

Applicant requests an interview prior to formal action on this amendment. An "Applicant Initiated Interview Request Form" accompanies this paper. Please contact Applicant's undersigned representative to schedule the interview.

Specification Amendment

The cross-reference to related applications section was amended to clarify that the related provisional application is being relied upon for priority, as clearly indicated on the originally filed Declaration.

Supplemental Declaration

A Supplemental Declaration is being filed concurrently with this Amendment to correct an obvious typographical error regarding the application number of the related provisional application. The original Declaration transposed the first two digits.

Prior Art Rejections

Claims 1-54 were rejected under 35 USC § 102(b) and 35 USC § 103(a) as allegedly being anticipated or unpatentable over SEC filing of 4 December 1998 (hereafter, "the '98 SEC filing") in view of different combinations of The '99 SEC filing (hereafter, "the '99 SEC filing"), U.S. Patent No. 5,132,899 (Fox), "Helping Employees" reference and Applicant's prior art admissions. These rejections are believed to be moot in view of the cancellation of claims

1-54. The new set of claims are believed to be patentable over these references for at least the reasons discussed below.

1. The '98 SEC filing

The '98 SEC filing discloses composing an investment fund portfolio as follows:

- a. analyzing the companies listed in the Value Line Investment Survey form;
- b. classifying each company into an industry category on the bases of primary business activity;
- c. ranking the industries by aggregating common stockholders' equity of all companies included within each industry;
- d. determining the fund's percentage investment in each industry based on the common stockholders' equity ranking; and
- e. selecting for investment one or more companies which have the highest common stockholders' equity within each industry.

Nowhere does the '98 SEC filing disclose or suggest that the number of securities selected for investing from a particular industry group is based on the relative industry size of the industry group, as recited in claim 55, clause (h). On page 17, last paragraph, of the Office Action dated January 2, 2004, the Examiner also recognizes this fact in stating that "the SEC filing *does not* specifically disclose...*setting* the number of securities in accordance with the magnitude of the industry total of the one industry group..." (emphasis in the original).

Applicant has carefully re-reviewed all of the Examiner's rejections and cannot find any discussion of why the Examiner believes this feature is obvious. In fact, this feature is believed to be novel and unobvious in the claimed method.

2. The '99 SEC filing is not prior art

As argued in previous responses, Applicant believes that the '99 SEC filing is not prior art because it does not qualify as a "printed publication" under 35 U.S.C. § 102(b)¹. To date, the Examiner has not accepted this argument. Assuming, *arguendo*, that the '99 SEC filing qualifies

¹ Under 35 USC 102(b), a United States patent on an invention is barred only if any of the following events occur more than a year before the application is filed:

- (1) the invention is patented or described in a printed publication available anywhere in the world;
- (2) the invention is in public use in the United States; or
- (3) the invention is on sale in the United States.

as a “printed publication” under 35 U.S.C. § 102(b), the ’99 SEC filing would still not be prior art because it was not published more than one year before the application was filed.

The present application claims priority from U.S. Provisional Application No. 60/181,718 filed February 11, 2000 which is less than one year after the date of the ’99 SEC filing of March 4, 1999. That is, after the alleged publication of the ’99 SEC filing of March 4, 1999, Applicant had one year (until March 4, 2000) in which to file a patent application to avoid a statutory bar deadline. Applicant met this deadline by filing the provisional application on February 11, 2000 which is almost one month before the potential statutory bar deadline. Appendix A is a time line that illustrates the relevant dates.

Furthermore, the contents of the present application are fully supported by the provisional application, and therefore, the claims of the present application are entitled to the priority date of the provisional application. The following documents are presented to support this fact:

1. Appendix B is a copy of Applicant’s provisional application.
2. Appendix C is a text comparison of the specification of Applicant’s provisional application and the specification of Applicant’s non-provisional application. The comparison shows that the technical description of the invention in the provisional and the non-provisional applications are identical in content. The drawings in the two applications are likewise identical in content.

Accordingly, Applicant is entitled to the priority date of the provisional application for the presently claimed invention, and therefore the ’99 SEC filing is not prior art against the present application, even if it qualifies as a “printed publication.”

Nor is the ’99 SEC filing prior art against the present application under any other sections of 35 U.S.C. § 102.

3. Patentability of independent claim 55

The prior art of record does not disclose or suggest at least the following limitations of claim 55:

(h) generating, using the data processing system, a list of securities in which to invest the funds in an investment portfolio such that the number of securities selected for investing from a particular industry group is based on the relative industry size of the industry group
(underlining added for emphasis)

As discussed above, the Examiner admits that this limitation is not present in the '98 SEC filing. None of the remaining previously applied prior art references make up for the deficiency in the '98 SEC filing.

4. Patentability of dependent claims

The dependent claims are believed to be allowable because they depend upon an allowable independent claim, and because they recite additional patentable limitations.

Conclusion

Insofar as the Examiner's rejections were fully addressed, the instant application is in condition for allowance. Issuance of a Notice of Allowability of all pending claims is therefore earnestly solicited.

Respectfully submitted,

GERALD P. SULLIVAN

APPARATUS AND METHOD FOR CREATING AND MANAGING A FINANCIAL INSTRUMENT

ABSTRACT

This invention builds portfolios of equity securities drawn from a large universe of companies sorted by industry and based on a common data element that is quantified by industry. The portfolio tracks the chosen data element (common shareholders equity for example) and creates a monthly portfolio allocation based on the percentage of an industry's data element relative to the universe total. Using industries to determine the amount of investment assigns the proper representation for the industry and when the investments are combined to form a portfolio, it determines a portfolio that is allocated properly for the chosen data item.

BACKGROUND OF THE INVENTION

Equity mutual funds of all shapes and sizes tend to have one thing in common. Greater than 95% of equity mutual funds are managed by an individual Portfolio Manager or Investment Committee and would be considered "actively" managed. The remaining majority of funds would be considered "passively" managed index funds. An index fund uses the same representative portfolio as the published index it seeks to replicate. The majority of equity indexes that are published are weighted by market capitalization (the market price of a stock times shares outstanding). Market capitalization weighted indexes differ only by their universe selection. By gate-keeping an index universe, committees responsible for an index exclude certain component equities from their sample to maintain a predetermined portfolio characteristic of price/earnings ratio and price to book ratio. Our invention, The Industry Leaders Strategy Model was developed to generate portfolios based on the same universe, but using different ingredients to determine the weightings. Our process creates portfolios that have different portfolio statistics that are determined by the weighting factor and not a predetermined outcome. We developed a unique methodology for weighting portfolios by different fundamental inputs.

There are a small number of proprietary "model" based mutual funds that because of their secretive nature are as variegated as the actively managed funds. This invention has the same goal as these proprietary models (to be differentiated from actively managed funds by association to a discipline), yet this invention attempts to use a rigid and unique methodology to achieve the creation of understandably allocated portfolios.

Summary of the Invention

The present invention provides a unique method for the creation of portfolios of equity securities. The process used by this invention creates model portfolios that are different because of the fundamental data used, and not by altering the selection universe. The first

application of this invention using common shareholders equity data as the input was accepted by the Securities and Exchange Commission for the presentation of a past performance in a mutual fund prospectus.

Brief Description of the Drawings

Figure 1 illustrates how the universe of equities is determined for all applications of this invention. There are common exclusions to the chosen universes that are predetermined. Figure 1 builds a frame broken down by industry that includes all companies to be aggregated by the invention.

Figure 2 illustrates how different data elements are used to create a universe aggregation that generates the portfolio allocation for a given industry. As different data elements are intruded into the process, different investment allocations by industry are created.

Figures 3-8 illustrate how an industry is represented by a unique set of leaders. This process has 6 steps of iteration available per industry. A fixed monthly allocation is created for each company that represents its industry.

Figure 9 illustrated the model mechanics in an algebraic expression.

Figure 10 illustrates an example of this invention's portfolio for the data element of common shareholders equity.

Detailed Description of the Invention.

The following example describes an illustrative embodiment of this invention with common shareholders equity as a selected data element input. Each application of the invention (using different data element inputs) creates a different investment strategy.

This illustrative embodiment produces a principal investment strategy that invests in a broad number of industries and companies with the highest common stockholders' equity in their respective industries and produces a portfolio of approximately 95 to 110 companies that can be systematically managed to replicate the specified investment allocations.

Referring now to Figure 1, there is shown data that is brought into the data processing system of this invention. Utilizing a public, published universe of equities, we sort the equities into their primary industries and prepare the system to incorporate data. Imported data can be incorporated from any known source including, among others, Standard & Poors Compustat®, The Value Line Investment Survey® and Bloomberg®. For this illustrative embodiment of the data processing system, we have chosen to illustrate our data processing system using the Value Line Investment Survey® ("Value Line") found in step 2. Value Line lists approximately the 1,700 of the largest publicly traded companies and classifies each company into an industry category, and is a good source to provide the contents of industries and representative companies for the previous 14 years. This established a fluid universe of equities to which we apply the data processing system. Step 4 sorts the industries and companies within each industry and formats them in a way that allows the data processing system to allow the universe to be refined.

To differentiate portfolios into international or domestic the invention using step 6 may exclude any population of equities or industries that an investment manager may choose in order to create a desired portfolio. Step 8 embodies an example of exclusions that are used for this illustration. The invention excludes from this illustrative example companies that are in the following foreign industries: Canadian Banks, Canadian Energy, Foreign Electronics/Entertainment and Foreign Telecommunications. Value Line publishes some data on investment companies which are excluded (closed-end domestic, foreign models, and income funds). We exclude from the universe companies whose shares are not directly traded in the United States (e.g., American Depositary Receipts, commonly referred to as "ADRs"). Finally, the present system excludes from the universe companies included in Value Line as "miscellaneous" but which have not yet been assigned an Industry category because the invention does not assign industry categorization. The portfolio created from steps 6 and 8 will include domestic multinational corporations, but a smaller number of foreign companies, which do not have the same data reporting requirements as domestic corporations.

Step 10 uses the universe "update cycle" to determine how often changes are made to a given industry. An update cycle is the frequency to which the universe is modified by the publisher. Value Line changes their industry compositions every 3 months (1 quarter) and the cycle is set to 1 quarter. Standard and Poors and Bloomberg have different update cycles so step 10 would be different for these universes. In establishing this example universe of stocks, the invention also adjusts the Industry category of "Banks" to include "Banks Midwest" so as to unify the banking Industry analysis. Step 12 sorts the companies into the editions (weekly updates, numbering 13) found in Value Line which allows for an organized presentation of data from this data processing system. Step 14 highlights the update cycle found in the universe and this illustrative example describes the weekly update found in Value Line's quarterly update cycle. Industries and companies are included in this invention only for the periods during which they are published in the chosen universe by step 12.

Figure 2 illustrates how a chosen data element is incorporated into the refined universe found in step 12. The invention has the ability to use any published data element for a public corporation. A data element is an input to which the data processing system is applied. Step 22 illustrates potential data elements such as market capitalization and net income, but is not a complete list of potential data inputs. Each data element that is applied to the invention produces a different investment style and therefore a different portfolio. Publicly available data is acquired, for example, electronically from the EDGAR database of the SEC for fundamental data elements like common shareholders equity, net income, net revenue, net earnings and total assets. A market data source such as Bloomberg is used to provide market capitalization data. The illustrative embodiment presented here uses common shareholders equity to produce a "Large Capitalized Value Styled Portfolio." Step 24 acquires the chosen data element and imports the data into this data processing system.

Step 26 totals the data element for all companies included in an industry for each month and step 28 totals the data elements for the selected universe. Finally, step 30 allocates an industry investment, which is calculated from the industry total divided by the universe

total as determined in step 28. This investment allocation is created on a systematic basis, e.g., monthly, and is denoted by variable I_a .

There are many ways to assign an investment allocation to an individual equity and create a unique portfolio. With the industry previously defined and a data element chosen, the individual investment allocation process can use one of 2 allocation options. An investment manager may choose to maintain a portfolio with a manageable number of equities (less than 200), or he can choose to have all industry members represented by their prominence with regard to the total industry amount (individual percent of data element with regard to the specific industry). The first method is illustrated in figures 3 through 8 and the second method is illustrated in figure 11.

The size of the industry's investment allocation determines how many representatives are used. Therefore to create a portfolio, the data processing system applies a redundant iteration for each included industry of the defined universe. In choosing this allocation method the investment manager would determine the maximum limit for the portfolio. Figure 3 through 8 illustrate the individual allocation limit using a value of 2.25. The example of 2.25% would limit an individual equity's portfolio representation to 2.25% of the total portfolio. By definition, the company with the largest data element for the given month would receive all of the industry's allocation determined by step 30.

As shown in figure 3, the process looks to determine the size of the industry in step 40. When the industry's amount is below the 2.25% value, the process continues to step 44. If the industry is larger than 2.25% then the process would skip to step 60. To determine the way a statistical tie would be broken, the data processing system allows for a significance test between the company with the largest data element and the next largest company. Step 44 illustrates a 2% value to determine if a statistical tie would be present and if so step 48 would split the allocation between the first 2 representatives of the industry. Step 46 would be used if no defined statistical tie is present, and the largest representative would be allocated the entire amount of the industry allocation. Step 50 takes the next industry back to step 40.

Figure 4, step 60 would capture industries greater than or equal to 2.25% and less than 4.5%. If the industry is greater than 4.5% the test in step 60 would send the process to step 80, as more fully shown in figure 5. Step 64 tests the significance of the leader by the previously defined 2.0%, and if there is no tie the data processing system goes to step 66 and the leader is assigned 2.25% and the next closest company is assigned $(I_a - 2.25\%)$. Step 68 would split the total amount of the industry between the two largest companies in the industry if the 2% significance test is failed and a tie is determined. Step 70 takes the next industry back to step 40.

Figure 5, step 80 captures industries greater than or equal to 4.5% and less than 6.75% of the total portfolio allocation. If the industry is greater than 6.75% step 80 would send the process to step 82 and be forwarded to step 120. Step 84 tests the significance of the leader (F_1) by the previously defined 2.0%. If there is no tie and the 2% significance test is passed, the data processing system goes to step 86 and the leader (F_1) is assigned 2.25% and

forwarded to step 88 for the 2% significance test between the second (F_2) and third (F_3) largest companies. Step 90 has the second company (F_2) clearing the 2% significance test and gaining the 2.25% limit. Step 92 tests for the 2% significance test between the third (F_3) and fourth (F_4) largest companies. Step 94 captures a 2% significance test tie and would split the remaining amount of the industry ($I_n - 4.5\%$) between (F_3) and (F_4) and forwarded to step 108 and forwarded back to step 40. Step 96 assigns 2.25% to (F_3) if the significance test in step 92 is passed and F_3 gained the remaining amount of the industry ($I_n - 4.5\%$). Step 98 captures a tie of the step 84 significance test, and assigns F_1 and F_2 2.25%. Step 100 is a significance test with step 102 having the third leader F_3 capturing the remaining balance of the industry ($I_n - 4.5\%$). From step 102 the data processing system forwards to step 108 and to be sent back to step 40. Step 104 represents a tie between F_3 and F_4 and allocates a split of the remaining balance of the industry ($I_n - 4.5\%$) and forwarded to step 108.

Figure 6, step 120 captures industries greater than or equal to 6.75% and less than 9.0% of the total portfolio allocation. If the industry is greater than 9.0% step 120 would send the process to step 122 and be forwarded to step 160. Step 124 tests the significance of the leader (F_1) by the previously defined 2.0%. If there is no tie and the 2% significance test is passed, the data processing system goes to step 126 and the leader (F_1) is assigned 2.25% and forwarded to step 128 for the 2% significance test between the second (F_2) and third (F_3) largest companies. Step 130 has the second company (F_2) clearing the 2% significance test and gaining the 2.25% limit and forwarded to step 132 and on to step 138. Step 134 assigns the tie between F_2 and F_3 2.25%, and forwarded to step 142. Step 136 captures the tie between F_1 and F_2 and assigns a value of 2.25%, and forwards to step 138. Step 138 tests for the 2% significance test between the third (F_3) and fourth (F_4) largest companies. Step 148 captures a 2% significance test tie and would split the remaining amount of the industry ($I_n - 4.5\%$) between (F_3) and (F_4) and forwarded to step 150 and forwarded back to step 40. Step 140 assigns 2.25% to (F_3) if the significance test in step 138 is passed. Step 142 is a significance test with step 144 having the fourth leader F_4 being assigned the remaining balance of the industry ($I_n - 6.75\%$). From step 144 the data processing system forwards to step 150 to be sent back to step 40. Step 146 represents a tie between F_4 and F_5 and allocates a split of the remaining balance of the industry ($I_n - 6.75\%$) and forwarded to step 150.

Figure 7, step 160 captures industries greater than or equal to 9.0% and less than 11.25% of the total portfolio allocation. If the industry is greater than 11.25% step 160 would send the process to step 162 and be forwarded to step 200. Step 164 tests the significance of the leader (F_1) by the previously defined 2.0%. If there is no tie and the 2% significance test is passed, the data processing system goes to step 166 and the leader (F_1) is assigned 2.25% and forwarded to step 168 for the 2% significance test between the second (F_2) and third (F_3) largest companies. Step 170 has the second company (F_2) clearing the 2% significance test and gaining the 2.25% limit and forwarded to step 172 and on to step 178. Step 174 assigns the tie between F_2 and F_3 2.25%, and forwarded to step 142. Step 136 captures the tie between F_1 and F_2 and assigns a value of 2.25%, and forwards to step 182. Step 178

tests for the 2% significance test between the third (F_3) and fourth (F_4) largest companies. Step 192 captures a 2% significance test tie and would assign 2.25% to both (F_3) and (F_4) and forwarded to step 194. Step 180 assigns 2.25% to (F_3) if the significance test in step 178 is passed. Step 182 is a significance test with step 184 having the fourth leader F_4 being assigned 2.25%. From step 184 the data processing system forwards to step 186 to apply the significance test to F_5 and F_6 . Step 190 represents a tie between F_5 and F_6 and allocates a split of the remaining balance of the industry ($I_n - 9.0\%$) and forwarded to step 198. Step 188 captures a clearance of the significance test and assigns F_5 the balance of the industry allocation ($I_n - 9.0\%$). Step 198 takes the process back to step 40.

Figure 8, step 200 captures industries greater than or equal to 11.25% and less than 13.00% of the total portfolio allocation. If the industry is greater than 13.00% step 202 would assign a limit on 13% to the industry and be returned back to step 200 with $I_n = 13.00\%$ (this size limit is included in this illustrative embodiment, but may be removed for other applications). Step 204 tests the significance of the leader (F_1) by the previously defined 2.0%. If there is no tie and the 2% significance test is passed, the data processing system goes to step 206 and the leader (F_1) is assigned 2.25% and forwarded to step 208 for the 2% significance test between the second (F_2) and third (F_3) largest companies. Step 210 has the second company (F_2) clearing the 2% significance test and gaining the 2.25% limit and forwarded to step 212 and on to step 218. Step 214 assigns the tie between F_2 and F_3 2.25%, and forwarded to step 226. Step 216 captures the tie between F_1 and F_2 and assigns a value of 2.25% to each company, and forwards to step 218. Step 218 tests for the 2% significance test between the third (F_3) and fourth (F_4) largest companies. Step 222 captures a 2% significance test tie and would assign 2.25% to both (F_3) and (F_4) and forwarded to step 224 and be forwarded to step 234. Step 220 assigns 2.25% to (F_3) if the significance test in step 218 is passed. Step 226 is a significance test between F_4 and F_5 with step 232 having the fourth leader F_4 clearing the significance test and being assigned 2.25%. Step 228 assigns F_4 and F_5 2.25% and is forwarded to step 230 and on to step 238. Step 234 applies the significance test to F_5 and F_6 . Step 244 represents a tie between F_5 and F_6 and allocates a split of the remaining balance of the industry ($I_n - 9.0\%$) and forwarded to step 246. Step 236 captures a clearance of the significance test of step 234 and assigns F_5 2.25% and forwards the process to step 238 for a significance test between F_6 and F_7 . If F_6 clears the significance test of step 238, it is assigned the balance of the industry ($I_n - 11.25\%$) and sent go step 246. Step 242 allocates the step 238 significance tie to F_6 and F_7 with a split of the remaining balance ($I_n - 11.15\%$). Step 198 takes the process back to step 40.

Figure 9 illustrates an algorithmic example of the illustrative embodiment, with an algorithmic example of the industries of the embodiment found in figure 10. When the data processing system is run, the following results of the illustrative embodiment were found.

Figure 11 illustrates the simple process of assigning each company of the chosen universe. If the more detailed portfolio is chosen by the investment manager, the data processing system would assign in step 300 the individual company's relative percent to the entire universe. Step 302 would include all members of the defined universe, and a large

portfolio would be created.

HISTORICAL PERFORMANCE OF THE INVENTION (using the illustrative embodiment)

The following table compares the actual performance of the Standard and Poor's Barra Value Index® ("S&P Barra Value") and the Russell 1000 Value Index® ("Russell 1000 Value"), with the hypothetical results of the illustrative embodiment of the invention (common shareholders equity) for various historical periods. Total returns of the Strategy Model are returns on a hypothetical portfolio whose results have been approved by the SEC that are included in a Prospectus for a mutual fund composed of stocks selected by the Strategy Model (common shareholders equity) and re-balanced monthly.

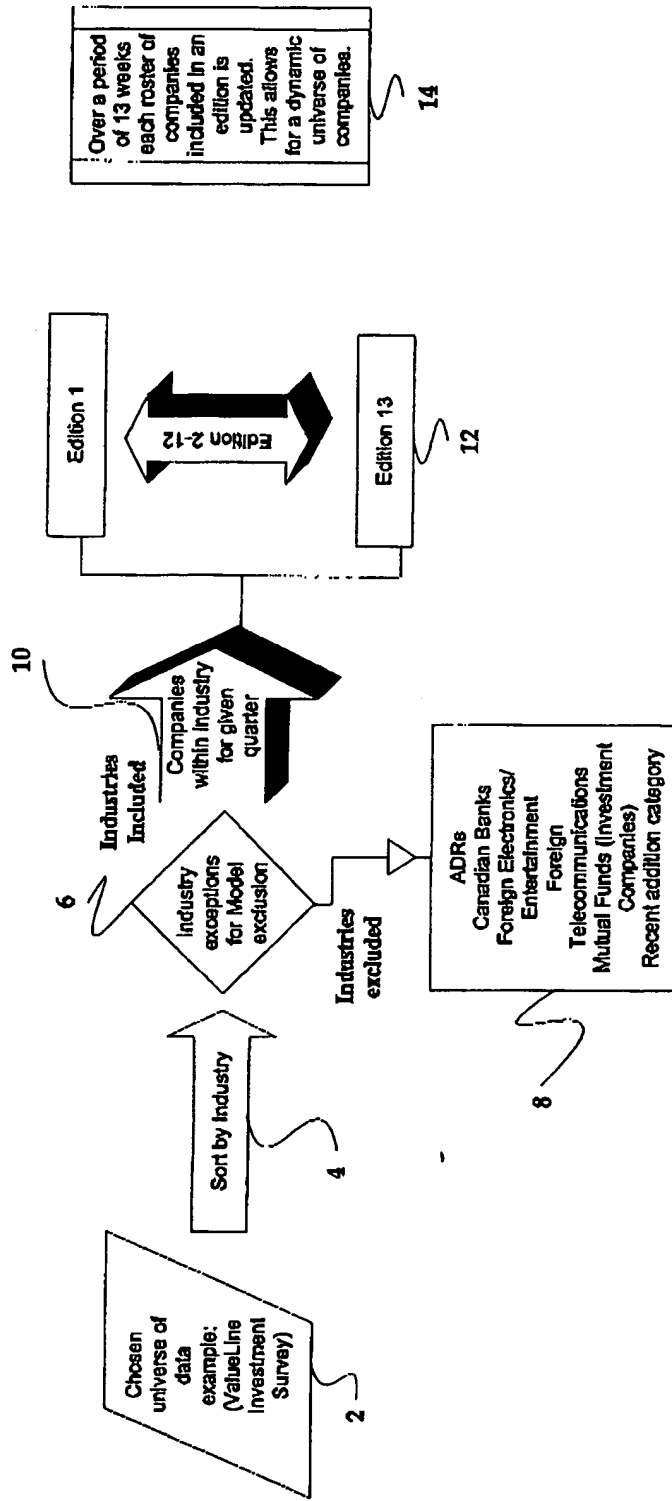

The S&P Barra Value and the Russell 1000 Value are indexes that have no costs or expenses of operation, however, its total return amounts reflect reinvestment of dividends for purposes of general comparison to this invention.

Comparative Historical Total Return Performance of this Invention

Please note that past results of this embodiment do not necessarily indicate future performance or earnings of the invention

Period	Industry Leaders Strategy Model®	S&P Barra Value Index®	Russell 1000 Value Index®
1 year			
12/31/98-12/31/99	10.89%	12.69%	7.66%
3 Years			
12/31/96-12/31/99	22.33%	18.87%	18.94%
5 years			
12/31/94-12/31/99	26.34%	22.93%	23.15%
10 Years			
12/31/99-12/31/99	17.26%	15.36%	15.63%
13 Years			
12/31/86-12/31/99	16.94%	15.90%	15.87%

Data Frame Phase (Universe Determination)

The Data Frame Phase determines the industries, companies, and time period to be included into the Model.

A different (of 13) edition is updated weekly by ValueLine and aggregated monthly by the model, so over a period of 3 months, all editions are updated.

Model Mechanics

Variable Definitions:

F= Monthly investment factor (allocation)

Pb= Price at beginning of month

Pe= Price at end of month

I_n = Industry(n)

C_z = Company(z)

j = number of Industries

k = number of companies within Industry

InCz= Company z within Industry n

BMValue= Value of Strategy model at end of preceding month (value of 1000 12/31/86)

Value of individual investments
at the beginning of the month

$$\sum_{z=1}^j [\sum_{n=1}^k F(InCz) BMValue]$$

Value of Strategy Model
at the end of the month

$$\sum_{z=1}^j [\sum_{n=1}^k (F(InCz) BMValue / Pb(InCz)) Pe(InCz)]$$

note: For the majority of the industries, k equals 1. Most industries have only one representative. Please refer to the 12/31/99 industry list found in Figure 10.

Individual Representation Within Industry for All Companies in the Selected Universe

Figure 11

APPENDIX C

(Attachment to Amendment Accompanying RCE Request
for U.S. Application No. 09/624,732)

APPARATUS AND METHOD FOR CREATING AND MANAGING A FINANCIAL INSTRUMENT

ABSTRACT OF THE INVENTION

~~This invention builds portfolios of equity securities drawn from a large universe of companies sorted by industry and based on a common data element that is quantified by industry. The portfolio tracks the chosen data element (common shareholders equity for example) and creates a monthly portfolio allocation based on the percentage of an industry's data element relative to the universe total. Using industries to determine the amount of investment assigns the proper representation for the industry and when the investments are combined to form a portfolio, it determines a portfolio that is allocated properly for the chosen data item.~~

A method is disclosed for allocating a portfolio investment among a population of securities held in an investment portfolio, wherein each security of the population of securities is issued by a company of a plurality of companies, and each security has at least one corresponding data element. The method includes the steps of assigning each security to a corresponding industry group, summing the industry total of each of the plurality of industry groups to provide the portfolio investment. One investment portion of the portfolio investment is distributed to at least one or more of the plurality of industry groups. The investment portion of the corresponding industry group is equal to a proportion of the industry total of the corresponding industry group to the portfolio investment. The investment portion may be distributed among a selected one or more of the securities of the corresponding industry group.

Reference to Related Applications

This application is related to U.S. Provisional Application Serial No. 60/181,718, filed February 11, 2000 in the name of Gerard P. Sullivan, entitled "APPARATUS AND METHOD

FOR CREATING AND MANAGING A FINANCIAL INSTRUMENT”, and incorporated herein by reference.

BACKGROUND OF THE INVENTION

Equity mutual funds of all shapes and sizes tend to have one thing in common. Greater than 95% of equity mutual funds are managed by an individual Portfolio Manager or Investment Committee and would be considered “actively” managed. The remaining majority of funds would be considered “passively” managed index funds. An index fund uses the same representative portfolio as the published index it seeks to replicate. The majority of equity indexes that are published are weighted by market capitalization (the market price of a stock times shares outstanding). Market capitalization weighted indexes differ only by their universe selection. By gate-keeping an index universe, committees responsible for an index exclude certain component equities from their sample to maintain a predetermined portfolio characteristic of price/earnings ratio and price to book ratio. Our invention, The Industry Leaders Strategy Model was developed to generate portfolios based on the same universe, but using different ingredients to determine the weightings. Our process creates portfolios that have different portfolio statistics that are determined by the weighting factor and not a predetermined outcome. We developed a unique methodology for weighting portfolios by different fundamental inputs.

There are a small number of proprietary “model” based mutual funds that because of their secretive nature are as variegated as the actively managed funds. This invention has the same goal as these proprietary models (to be differentiated from actively managed funds by association to a discipline), yet this invention attempts to use a rigid and unique methodology to achieve the creation of understandably allocated portfolios.

Summary of the Invention

~~The present invention provides a unique method for the creation of portfolios of equity securities. The process used by this invention creates model portfolios that are different because of the fundamental data used, and not by altering the selection universe. The first application of this invention using common shareholders equity data as the input was accepted by the Securities and Exchange Commission for the presentation of a past performance in a mutual fund prospectus.~~

It is an object of this invention to provide a method for the creation of portfolios of equity securities that does not require active management.

It is an object of this invention to provide a method of investment allocation based upon the data elements of the securities included within the investment portfolio.

In accordance with these and other objects of this invention, there is disclosed a method of allocating a portfolio investment among a population of securities held in an investment portfolio, wherein each security of the population of securities is issued by a company of a plurality of companies, and each security has at least one corresponding data element. The method includes the steps of assigning each security to a corresponding industry group, summing one of the corresponding data elements of each of the securities assigned to said corresponding industry group to provide an industry total for the corresponding industry group, and summing the industry total for each of the plurality of industry groups to provide the portfolio investment. Finally, a one investment portion of the portfolio investment is distributed to at least one or more of the plurality of industry groups.

In a further aspect of this invention, at least some of the population of securities is updated on a periodic cycle. Further, the plurality of securities are subdivided into a plurality of editions, wherein each edition is updated on a cycle that is staggered from the cycles of the other editions.

In a still further feature of this invention, the investment portion of the corresponding industry group is equal to a proportion of the industry total of the corresponding industry group

to the portfolio investment. Further, the investment portion is distributed among a selected one or more of the securities of the corresponding industry group. In one embodiment of this invention, the investment portion is distributed to at least that security of the corresponding industry group that has the largest data element of the securities assigned to the corresponding industry group. In a further embodiment, two or more parts of the investment portion are allocated to two or more of the securities of the corresponding industry group that have the largest data elements.

In a still further aspect of the invention, the part of the investment portion allocated to a single security is set to not exceed a predetermined amount.

Brief Description of the Drawings

Figure 1 illustrates how the universe of equities is determined for all applications of this invention. There are common exclusions to the chosen universes that are predetermined. Figure 1 builds a frame broken down by industry that includes all companies to be aggregated by the invention.

Figure 2 illustrates how different data elements are used to create a universe aggregation that generates the portfolio allocation for a given industry. As different data elements are intruded into the process, different investment allocations by industry are created.

Figures 3--8 illustrate how an industry is represented by a unique set of leaders. This process has 6 steps of iteration available per industry. A fixed monthly allocation is created for each company that represents its industry.

Figure 9 ~~illustrated~~illustrates the model mechanics in an algebraic expression.

Figure 10 illustrates an example of this invention's portfolio for the data element of common shareholders equity.

Detailed Description of the Invention

The following example describes an illustrative embodiment of this invention with common shareholders equity as a selected data element input. Each application of the invention (using different data element inputs) creates a different investment strategy.

This illustrative embodiment produces a principal investment strategy that invests in a broad number of industries and companies with the highest common stockholders' equity in their respective industries and produces a portfolio of approximately 95 to 110 companies that can be systematically managed to replicate the specified investment allocations.

Referring now to Figure 1, there is shown data that is brought into the data processing system of this invention. Utilizing a public, published universe of equities, we sort the equities into their primary industries and prepare the system to incorporate data. Imported data can be incorporated from any known source including, among others, Standard & Poors Compustat®, The Value Line Investment Survey® and Bloomberg®. For this illustrative embodiment of the data processing system, we have chosen to illustrate our data processing system using the Value Line Investment Survey® ("Value Line") found in step 2. Value Line lists approximately the 1,700 of the largest publicly traded companies and classifies each company into an industry category, and is a good source to provide the contents of industries and representative companies for the previous 14 years. This established a fluid universe of equities to which we apply the data processing system. Step 4 sorts the industries and companies within each industry and formats them in a way that allows the data processing system to allow the universe to be refined.

To differentiate portfolios into international or domestic the invention using step 6 may exclude any population of equities or industries that an investment manager may choose in order to create a desired portfolio. Step 8 embodies an example of exclusions that are used for this illustration. The invention excludes from this illustrative example companies that are in the following foreign industries: Canadian Banks, Canadian Energy, Foreign Electronics/Entertainment and Foreign Telecommunications. Value Line publishes some data on investment companies which are excluded (closed-end domestic, foreign models, and income funds). We exclude from the universe companies whose shares are not directly traded in the United States (e.g., American Depositary Receipts, commonly referred to as “ADRs”). Finally, the present system excludes from the universe companies included in Value Line as “miscellaneous” but which have not yet been assigned an Industry category because the invention does not assign industry categorization. The portfolio created from steps 6 and 8 will include domestic multinational corporations, but a smaller number of foreign companies, which do not have the same data reporting requirements as domestic corporations.

Step 10 uses the universe “update cycle” to determine how often changes are made to a given industry. An update cycle is the frequency to which the universe is modified by the publisher. Value Line changes their industry compositions every 3 months (1 quarter) and the cycle is set to 1 quarter. Standard and Poors and Bloomberg have different update cycles so step 10 would be different for these universes. In establishing this example universe of 4 stocks, the invention also adjusts the Industry category of “Banks” to include “Banks Midwest” so as to unify the banking Industry analysis. Step 12 sorts the companies into the editions (weekly updates, numbering 13) found in Value Line which allows for an organized presentation of data from this data processing system. Step 14 highlights the update cycle found in the universe and

this illustrative example describes the weekly update found in Value Line's quarterly update cycle. Industries and companies are included in this invention only for the periods during which they are published in the chosen universe by step 12.

Figure 2 illustrates how a chosen data element is incorporated into the refined universe found in step 12. The invention has the ability to use any published data element for a public corporation. A data element is an input to which the data processing system is applied. Step 22 illustrates potential data elements such as market capitalization and net income, but is not a complete list of potential data inputs. Each data element that is applied to the invention produces a different investment style and therefore a different portfolio. Publicly available data is acquired, for example, electronically from the EDGAR database of the SEC for fundamental data elements like common shareholders equity, net income, net revenue, net earnings and total assets. A market data source such as Bloomberg is used to provide market capitalization data. The illustrative embodiment presented here uses common shareholders equity to produce a "Large Capitalized Value Styled Portfolio." Step 24 acquires the chosen data element and imports the data into this data processing system.

Step 26 totals the data ~~element~~elements for all companies included in an industry for each month and step 28 totals the data elements for the selected universe. Finally, step 30 allocates an industry investment, which is calculated from the industry total divided by the universe total as determined in step 28. This investment allocation is created on a systematic basis, e.g., monthly, and is denoted by variable $I_{n,t}$.

There are many ways to assign an investment allocation to an individual equity and create a unique portfolio. With the industry previously defined and a data element chosen, the individual investment allocation process can use one of 2 allocation options. An investment

manager may choose to maintain a portfolio with a manageable number of equities (less than 200), or he can choose to have all industry members represented by their prominence with regard to the total industry amount (individual percent of data element with regard to the specific industry). The first method is illustrated in figures 3 through 8 and the second method is illustrated in figure 11.

The size of the industry's investment allocation determines how many representatives are used. Therefore to create a portfolio, the data processing system applies a redundant iteration for each included industry of the defined universe. In choosing this allocation method, the investment manager would determine the maximum limit for the portfolio. Figure 3 through 8 illustrate the individual allocation limit using a value of 2.25. The example of 2.25% would limit an individual equity's portfolio representation to 2.25% of the total portfolio. By definition, the company with the largest data element for the given month would receive all of the industry's allocation determined by step 30.

As shown in figure 3, the process looks to determine the size of the industry in step 40. When the industry's amount is below the 2.25% value, the process continues to step 44. If the industry is larger than 2.25% then the process would skip to step 60. To determine the way a statistical tie would be broken, the data processing system allows for a significance test between the company with the largest data element and the next largest company. Step 44 illustrates a 2% value to determine if a statistical tie would be present and if so step 48 would split the allocation between the first 2 representatives of the industry. Step 46 would be used if no defined statistical tie is present, and the largest representative would be allocated the entire amount of the industry allocation. Step 50 takes the next industry back to step 40.

Figure 4, step 60 would capture industries greater than or equal to 2.25% and less than 4.5%. If the industry is greater than 4.5% the test in step 60 would send the process to step 80, as more fully shown in figure 5. Step 64 tests the significance of the leader by the previously defined 2.0%, and if there is no tie the data processing system goes to step 66 and the leader is assigned 2.25% and the next closest company is assigned ($I_n \leq 2.25\%$). Step 68 would split the total amount of the industry between the two largest companies in the industry if the 2% significance test is failed and a tie is determined. Step 70 takes the next industry back to step 40.

Figure 5, step 80 captures industries greater than or equal to 4.5% and less than 6.75% of the total portfolio allocation. If the industry is greater than 6.75%, step 80 would send the process to step 82 and be forwarded to step 120. Step 84 tests the significance of the leader (F_1) by the previously defined 2.0%. If there is no tie and the 2% significance test is passed, the data processing system goes to step 86 and the leader (F_1) is assigned 2.25% and forwarded to step 88 for the 2% significance test between the second (F_2) and third (F_3) largest companies. Step 90 has the second company (F_2) clearing the 2% significance test and gaining the 2.25% limit. Step 92 tests for the 2% significance test between the third (F_3) and fourth (F_4) largest companies. Step 94 captures a 2% significance test tie and would split the remaining amount of the industry ($I_n \leq 4.5\%$) between (F_3) and (F_4) and forwarded to step 108 and forwarded back to step 40. Step 96 assigns 2.25% to (F_3) if the significance test in step 92 is passed and F_3 gained the remaining amount of the industry ($I_n \leq 4.5\%$). Step 98 captures a tie of the step 84 significance test, and assigns F_1 and F_2 2.25%. Step 100 is a significance test with step 102 having the third leader F_3 capturing the remaining balance of the industry ($I_n \leq 4.5\%$). From step 102 the data processing system forwards to step 108 and to be sent back to step 40. Step 104 represents a tie between F_3

and F_4 and allocates a split of the remaining balance of the industry ($I_n \approx 4.5\%$) and forwarded to step 108.

Figure 6, step 120 captures industries greater than or equal to 6.75% and less than 9.0% of the total portfolio allocation. If the industry is greater than 9.0%, step 120 would send the process to step 122 and be forwarded to step 160. Step 124 tests the significance of the leader (F_1) by the previously defined 2.0%. If there is no tie and the 2% significance test is passed, the data processing system goes to step 126 and the leader (F_1) is assigned 2.25% and forwarded to step 128 for the 2% significance test between the second (F_2) and third (F_3) largest companies. Step 130 has the second company (F_2) clearing the 2% significance test and gaining the 2.25% limit and forwarded to step 132 and on to step 138. Step 134 assigns the tie between F_2 and F_3 2.25%, and forwarded to step 142. Step 136 captures the tie between F_1 and F_2 and assigns a value of 2.25%, and forwards to step 138. Step 138 tests for the 2% significance test between the third (F_3) and fourth (F_4) largest companies. Step 148 captures a 2% significance test tie and would split the remaining amount of the industry ($I_n \approx 4.5\%$) between (F_3) and (F_4) and forwarded to step 150 and forwarded back to step 40. Step 140 assigns 2.25% to (F_3) if the significance test in step 138 is passed. Step 142 is a significance test with step 144 having the fourth leader F_4 being assigned the remaining balance of the industry ($I_n \approx 6.75\%$). From step 144 the data processing system forwards to step 150 to be sent back to step 40. Step 146 represents a tie between F_4 and F_5 and allocates a split of the remaining balance of the industry ($I_n \approx 6.75\%$) and forwarded to step 150.

Figure 7, step 160 captures industries greater than or equal to 9.0% and less than 11.25% of the total portfolio allocation. If the industry is greater than 11.25%, step 160 would send the process to step 162 and be forwarded to step 200. Step 164 tests the significance of the leader

(F₁) by the previously defined 2.0%. If there is no tie and the 2% significance test is passed, the data processing system goes to step 166 and the leader (F₁) is assigned 2.25% and forwarded to step 168 for the 2% significance test between the second (F₂) and third (F₃) largest companies. Step 170 has the second company (F₂) clearing the 2% significance test and gaining the 2.25% limit and forwarded to step 172 and on to step 178. Step 174 assigns the tie between F₂ and F₃ 2.25%, and forwarded to step 142. Step 136 captures the tie between F₁ and F₂ and assigns a value of 2.25%, and forwards to step 182. Step 178 tests for the 2% significance test between the third (F₃) and fourth (F₄) largest companies. Step 192 captures a 2% significance test tie and would assign 2.25% to both (F₃) and (F₄) and forwarded to step 194. Step 180 assigns 2.25% to (F₃) if the significance test in step 178 is passed. Step 182 is a significance test with step 184 having the fourth leader F₄ being assigned 2.25%. From step 184 the data processing system forwards to step 186 to apply the significance test to F₅ and F₆. Step 190 represents a tie between F₅ and F₆, and allocates a split of the remaining balance of the industry ($I_n = 9.0\%$) and forwarded to step 198. Step 188 captures a clearance of the significance test and assigns F₅ the balance of the industry allocation ($I_n = 9.0\%$). Step 198 takes the process back to step 40.

Figure 8, step 200 captures industries greater than or equal to 11.25% and less than 13.00% of the total portfolio allocation. If the industry is greater than 13.00%, step 202 would assign a limit on 13% to the industry and be returned back to step 200 with $I_n = 13.00\%$ (this size limit is included in this illustrative embodiment, but may be removed for other applications). Step 204 tests the significance of the leader (F₁) by the previously defined 2.0%. If there is no tie and the 2% significance test is passed, the data processing system goes to step 206 and the leader (F₁) is assigned 2.25% and forwarded to step 208 for the 2% significance test between the second (F₂) and third (F₃) largest companies. Step 210 has the second company (F₂) clearing the

2% significance test and gaining the 2.25% limit and forwarded to step 212 and on to step 218. Step 214 assigns the tie between F_2 and F_3 2.25%, and forwarded to step 226. Step 216 captures the tie between F_1 and F_2 and assigns a value of 2.25% to each company, and forwards to step 218. Step 218 tests for the 2% significance test between the third (F_3) and fourth (F_4) largest companies. Step 222 captures a 2% significance test tie and would assign 2.25% to both (F_3) and (F_4) and forwarded to step 224 and be forwarded to step 234. Step 220 assigns 2.25% to (F_3) if the significance test in step 218 is passed. Step 226 is a significance test between F_4 and F_5 with step 232 having the fourth leader F_4 clearing the significance test and being assigned 2.25%. Step 228 assigns F_4 and F_5 2.25% and is forwarded to step 230 and on to step 238. Step 234 applies the significance test to F_5 and F_6 . Step 244 represents a tie between F_5 and F_6 and allocates a split of the remaining balance of the industry ($I_n = 9.0\%$) and forwarded to step 246. Step 236 captures a clearance of the significance test of step 234 and assigns F_5 2.25% and forwards the process to step 238 for a significance test between F_6 and F_7 . If F_6 clears the significance test of step 238, it is assigned the balance of the industry ($I_n = 11.25\%$) and sent go step 246. Step 242 allocates the step 238 significance tie to F_6 and F_7 with a split of the remaining balance ($I_n = 11.15\%$). Step 198 takes the process back to step 40.

Figure 9 illustrates an algorithmic example of the illustrative embodiment, with an algorithmic example of the industries of the embodiment found in figure 10. When the data processing system is run, the following results of the illustrative embodiment were found.

Figure 11 illustrates the simple process of assigning each company of the chosen universe. If the more detailed portfolio is chosen by the investment manager, the data processing system would assign in step 300 the individual company's relative percent to the entire universe.

Step 302 would include all members of the defined universe, and a large portfolio would be created.

HISTORICAL PERFORMANCE OF THE INVENTION

(using the illustrative embodiment)

The following table compares the actual performance of the Standard and Poor's Barra Value Index® (D ("S&P Barra Value") and the Russell 1000 Value Index® ("Russell 1000 Value"), with the hypothetical results of the illustrative embodiment of the invention (common shareholders equity) for various historical periods. Total returns of the Strategy Model are returns on a hypothetical portfolio whose results have been approved by the SEC that are included in a Prospectus for a mutual fund composed of stocks selected by the Strategy Model (common shareholders equity) and re-balanced monthly.

The S&P Barra Value and the Russell 1000 Value are indexes that have no costs or expenses of operation, however, its total return amounts reflect reinvestment of dividends for purposes of general comparison to this invention.

Comparative Historical Total Return Performance of this Invention

Please note that past results of this embodiment do not necessarily indicate future performance or earnings of the invention

Applicant Initiated Interview Request Form

Application No.: 09/624,732

First Named Applicant: Gerald P. Sullivan

Examiner: James Zurita

Art Unit: 3625

Status of Application: awaiting action

subsequent to
filing of "Amendment
Accompanying
RCE"

Tentative Participants:

(1) Clark Jablon (2) Gerald Sullivan

(3) Examiner Zurita (4) _____

Proposed Date of Interview: to be determined Proposed Time: _____ (AM/PM)

after entry of Amendment Accompanying RCE

Type of Interview Requested:

(1) ☐ Telephonic (2) ☒ Personal (3) ☐ Video Conference

Exhibit To Be Shown or Demonstrated: ☐ YES ☒ NO

If yes, provide brief description: _____

Issues To Be Discussed

Issues (Rej., Obj., etc)	Claims/ Fig. #s	Prior Art	Discussed	Agreed	Not Agreed
(1) <u>Rej.</u>	<u>all pending</u> <u>claims</u>	<u>'98 SEC filing</u> <u>and</u> <u>'99 SEC filing</u>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

SUPPLEMENTAL DECLARATION
(ORIGINAL APPLICATION)

As a below named inventor, I hereby declare that:

My residence, post office address and citizenship are as stated below next to my name.

I believe I am the original, first and sole inventor (if only one name is listed below) or an original, first and joint inventor (if plural names are listed below) of the subject matter which is claimed, as amended by any and all amendments entered during the prosecution of the patent application identified herein, and for which a patent is sought on the invention entitled:

**APPARATUS AND METHOD FOR CREATING AND
MANAGING A FINANCIAL INSTRUMENT**

the specification of which was filed on July 25, 2000 as Application No. 09/624,732.

I hereby state that I have reviewed and understand the contents of the above-identified specification, including the claims, as amended by any and all amendments entered during the prosecution of the application.

I acknowledge the duty to disclose information which is material to patentability in accordance with Title 37, Code of Federal Regulations, Section 1.56.

I hereby claim foreign priority benefits under Title 35, United States Code, Section 119(a)-(d), of any foreign application(s) for patent or inventor's certificate listed below and have also identified below any foreign application for patent or inventor's certificate having a filing date before that of the application on which priority is claimed:

FOREIGN PRIORITY APPLICATION(S)

<u>none</u>		
(Number)	(Country)	(Day/month/year filed)

Priority Claimed
☐ Yes ☐ No

I hereby claim the benefit under Title 35, United States Code §119(e) of any United States provisional patent application(s) listed below:

PROVISIONAL PRIORITY PATENT APPLICATION(S)
